The cDNA was initially identified in Incyte Clone ID No. 1271505CB1, The CDNA was initially identified in Incyte Clone ID No. 1271505CB1, CC from a foetal lung tissue library. The PPHKP-5 gene was localised to human chromosome 20. Tissues that express PPHKP-5 (as a fraction of total tissues expressing PPHKP-5) include reproductive (0.288), gastrointestinal (0.212) and haematopoietic or immune (0.192). Diseases or conditions associated with tissues expressing PPHKP-5 (as a fraction of total tissues expressing PPHKP-5) include cancer (0.579), inflammation or trauma (0.327) and cell proliferation (0.308). The encoded protein shows homology to rat kinase. The invention provides human PPHKP-1 to -11 polypeptides (see AAR20323-32) and polynucleotides (see AAR20476-86). It also provides expression vectors, host cells, antibodies, agonists and antagonists, as well as methods for diagnosing, treating or preventing disorders, associated with expression of PPHKP, including gastrointestinal disorders, immune system disorders, neurological disorders and cell proliferative disorders, including cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The invention relates to human nucleic acids (AAI57798-AAI61369) and CC the encoded polypeptides (AAM38642-AAM4221)) with nootropic, immunosuppressant and cytostatic activity. The polynuclectides are useful CC in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and CC localised neuropathies and central nervous system diseases, such as CC lateral sclerosis, and Shy-Drager Syndrome. Other uses include the CC utilisation of the activities such as: Immune system diseases, haemostatic activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic CC and thrombolytic activity, cancer diagnosis and therapy, drug screening, CC assays for receptor activity, arthritis and inflammation, leukaemias and CC utilisation of the sequence data for this patent did not form part of the printed cyc specification.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypnucleotides are useful in gene therapy. A composition containing a polypeptide or polypnucleotide of the invention may be used to treat diseases of the peripheral nervous

Nucleic acids encoding human kinase polypeptides, useful for preventing diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections -

Example 1; Figure 1; 433pp; English.

CC AASO6701-AASO6757 encode for novel human protein kinases #1-57. The CC novel protein kinases have been identified as members of the tyrosine CC or serine/threonine kinase (PTK and STK) families. The polynucleotides CC encoding protein kinases and the polypeptides may be used in the CC prevention, diagnosis and treatment of diseases associated with CC inappropriate kinase expression. For example, they may be used to treat CC cancers (especially cancers of haematopoietic origin), cardiovascular CC disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), CC immune related diseases (e.g. rheumatoid arthritis), neurological CC disorders (e.g. schizophrenia), neurodegenerative disorders (e.g. Gratkinson's disease), inflammatory disorders (e.g. asthma), infectious CC disease (e.g. HIV) and reproductive disorders (e.g. asthma), infectious CC disease (e.g. HIV) and reproductive disorders (e.g. asthma), infectious CC used for gene therapy and as DNA probes in diagnostic assays. CC used for gene therapy and as DNA probes in dispositic assays. CC of antibodies against the protein kinases and in assays to identify condulators of protein kinase expression and activity.

                                                                      문
                                                                                                 Ś
                                                                                                                                                                                                              The invention provides an isolated human tribbles homologue-1 (htrb-1, CC also known as stress kinase inhibitor protein (SKIP-1)) polypeptide. The CC htrb polypeptide is useful for inhibiting an AP-1 mediated inflammatory (Signal in a cell. The polypeptide employed in the method is preferably (CC htrb-1, htrb-1 N htrb-1 C, htrb-1 N C, htrb-3 N trb-3). Ntrb-3 C, or CC htrb-3 N C. It is also useful for providing htrb agonist activity for CC activating an ERK-mediated signal e.g. AP-1-mediated gene activation (CG signal, an estrogen receptor-mediated gene activation signal, an CC fibroblast growth factor (FGP) induced signal, or a PMA induced signal, an CC fibroblast growth factor (FGP) induced signal, or a PMA induced signal, or a fibroblast growth factor (FGP) induced signal, or a pmd induced signal, or a fibroblast growth factor (FGP) induced signal, or a pmd induced factor (TNF) (CC induced inflammatory signal, or an interleukin induced inflammatory signal, or an interleukin induced inflammatory compounds e.g. for treating and/or preventing diseases caused by abnormal htrb activity, such as rheumatoid arthritis, diseases caused by abnormal htrb activity, such as rheumatoid arthritis, diseases caused CC psoriasis, osteoporosis, diabetic retinopathy, myocardial infarction CC and cancers. The htrb therapeutics are useful for antagonizing CC interleukin-1 dependent disorders of human placenta, intraventricular hemorrhage, neonatal white matter damage and subsequent cerebral palsy, a nording reaching reaching disorders. The present sequence represents

Claim ۲, Page 7; 60pp; English

The present sequence encodes a partial polypeptide which has kinase activity. The kinase polynucleotides can be used to express the polypeptides, and as probes to identify nucleic acids encoding proteins having kinase activity. The kinase polypeptides and controls for peptides fragmented polypeptides are used as molecular weight and isoelectric focusing markers, and as controls for peptide fragmentation. They also have a number of therapeutic uses as kinases play a central role in cellular signal transduction. The polypeptides could also be used to identify binding partner proteins. The polypeptides can also be used as a reagent to identify any proteins that the polypeptide regulates, and proteins with which it might interact. The polypeptides may also be used for preparation of antibodies. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein by immunosffinity chromatography.

The PKIN polypeptides can be expressed using standard recombinant methodology. The PKIN polypeptides, polynucleotides, modulators and specific antibodies are useful in the diagnosis, treatment and prevention of cancer, immune disorders, disorders affecting growth and development, atherosclerosis, and other cardiovascular diseases, and lipid disorders and in the assessment of the effects of exogenous compounds on the expression of nucleic acid sequences of human kinases. The present sequence represents a cDNA encoding a human PKIN-10 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          isolated human kinase polypeptides useful in the diagnosis, treatment and prevention of cancer, immune disorders and disorders affecting growth and development -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

CC ABL39691 to ABL39818 represent novel human nucleic acid sequences CC (NS) can have cytostatic, osteopathic, gynaecological, neuroprotective, CC antirheumatic, antiarthritic, antipsoriatic, ophthalmological, virucide, CC vasotropic, antiarteriosclerotic, antiafertility, cardiovascular, cardiovascular, anti-HIV, antiinfertility, cardiovascular, cardiovascular, anticonvulsant, antidiabetic, tranquilliser, anticier, CC anticoagulant, anticonvulsant, antidiabetic, tranquilliser, antidicer, CC antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, CC antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, CC antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, CC oncropic and contraceptive activities. The NS can be used in vaccines, CC gene thorapy and antisense therapy. Nucleic acids, expression vectors and CC diagnosing e.g. cancer, osteoporosis, endometriosis, degenerative CC disease, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis, CC glaucoma, obseity, muscular dystrophy, AIDS, infertility, cardiovascular CC disease, coagulation disease, ischaemia, hypertension, asthma, immune CC disease, epilepsy, angina, neurodegeneration, diabetes, anxiety, CC depression, schizophrenia, viral disease, gastric ulcers, stroke, CC Alzheimer's disease and as a contraceptive.

                              ABL39691 to ABL39818 represent novel human nucleic acid sequences encoding the proteins given in ABB6637 to ABB664. The novel sequences (NS) can have cytostatic, osteopathic, gymaecological, neuroprotective, antirheumatic, antiarthritic, antipporiatic, ophthalmological, virucide, vasotropic, antiarteriosclerotic, antiantiamatory, dermatological, vasotropic, antiarteriosclerotic, antiarterioscl

                                                                                 ঠ
                                                                                                                      밁
                                                                                                                                                    ş
                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC constraint promatal activity of (II) is useful in gene therapy techniques CC (II), (II) is useful for generating antibodies against it, detecting or CC (II), (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC as food supplement. (II) and its binding partners are useful in medical case of disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations (CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC The spolar coding sequences of the invention.

CC control the sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tumour polypeptides (II). (I) is useful for stimulating an immune response in a patient and treating colon cancer in a patient.
Oligonucleotides derived from (I) are useful for determining the presence of cancer in a patient. (I) and (II) are useful in pharmaceutical compositions, e.g. vaccines, and other compositions for the diagnosis and treatment of colon cancer. A composition comprising a first component selected from physiologically acceptable carriers and immunostimulants, and an antigen-presenting cell expressing (II) is useful for inhibiting development of cancer in a patient. (I) is useful in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and (I). ABK5431-ABK55464 represent human colon cancer cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC (S1) can be used for detecting ovarian cancer in a patient's biological CC sample preferably serum or ovarian tissue. The method comprises CC contacting a biological sample from a patient with (IV), detecting the CC contacting a biological sample from a patient with (IV), detecting the CC amount of polynucleotide hybridising to (IV) and comparing the amount to garient, where the amount of polynucleotide hybridising to (IV) are cancer in the CC patient, where the amount of polynucleotide hybridising to (IV) is CC detected preferably by polymerase chain reaction (PCR). (I) comprising CC (III) and/or (II) is useful for stimulating and/or expanding T cells CC specific for an ovarian tumour protein comprising contacting T cells CC with (III) or (II). (III) is useful in design and preparation of CC and proteins in tumour cells; and to isolate a full length gene from a contacting in tumour cells; and to isolate a full length gene from a contacting contacting T cells; and to isolate a full length gene from a contacting to the tumour cells; and to isolate a full length gene from a contacting to the contacting to contact contacting to contact to contact contact
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The sequences can be used in detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous. They can also be used to inhibit tumour growth by modulating expression of a gene product. Ak336943-Ak33938 represent novel human diagnostic and therapeutic coding sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Williams LT, Escobedo J, Innis MA, Garcia PD, Sudduth-Klir
